What is a variable?
A variable is where you store information and value. It could be anything from strings to numbers
How do you store values in a variable?
Write a variable name, then use the equals symbol to assign to to a value. Example: animal = "dog"

Thoughts on my Two Views:

Looking at the two views I have made, I would say that I did a decent job at making the views easy to view and figure out where everything is within the views. The navbar is clearly visible and the search bar is clearly displayed. In the threads page, the text boxes to input questions and view answers are laid out effectively. Some things I would change is add more visuals to my pages, especially the home page. My home page only consists of text which would probably not look as appealing to a user since people tend to not like reading large bodies of text. It would be better if I have images and other visuals to make the home page more interesting and appealing. In the threads page, I feel that it is a little bland with just text boxes to look at. There should be an option to upload files and pictures that users can look at, for example diagrams that will help people who are asking questions about something. I feel like more could be added to the home page like a area that shows quick reminders of upcoming deadlines or suggestions on how a user can get caught up if they haven't been on the application for a while.
